GERMICIDAL ULTRAVIOLET

Ultraviolet water purification is a unique and rapid method of water disinfection without the use of heat or chemicals.

MINIPURE® Germicidal Ultraviolet Water Purifiers utilize UV-C lamps producing ultraviolet wavelengths at 254 nanometers (nm)—a level that is lethal to bacteria, viruses, and other microorganisms present in water.

Through the years ultraviolet technology has become well established as a method of choice for effective and economical water disinfection.

MINIPURE® Ultraviolet Water Purifiers are the ideal solution for an ever growing range of water treatment applications.

OPERATING CHARACTERISTICS

Approximately 95% of the ultraviolet energy emitted from **STER-L-RAY®** germicidal lamps is at 254 nanometers, the region of germicidal effectiveness most destructive to bacteria, mold, and viruses.

GENUINE **STER-L-RAY®** GERMICIDAL ULTRAVIOLET LAMPS

STER-L-RAY® Germicidal Ultraviolet Lamps are shortwave, low pressure tubes that produce ultraviolet wavelengths lethal to microorganisms.

STER-L-RAY® Germicidal Ultraviolet Lamps are well suited to applications requiring high ultraviolet intensity, such as water purification.

STER-L-RAY® Preheat Germicidal Ultraviolet Lamps are operated by a preheat-start circuit that employs an economical ballast. The preheat circuit requires four electrical connections per lamp and a slight to moderate delay is needed to start the lamp.

STER-L-RAY® and the **STER-L-RAY®** logo are trademarks of Atlantic Ultraviolet Corporation®.

CAUTION: Exposure to direct or reflected germicidal ultraviolet rays will cause painful eye irritation and reddening of the skin. Personnel subject to such exposure must wear suitable face shield, gloves, and protective clothing.

APPLICATIONS FOR ULTRAVIOLET WATER PURIFICATION

The unique advantage of UV purification is that nothing is added to the water. When chemical methods of treatment are used, there may be handling problems, taste and odor problems, and undesirable chemical reactions with substances present in the water.

This difference is most significant when producing water for:

- Drinking or swimming
- Processing foods and bottled beverages
- Manufacturing cosmetics or pharmaceuticals
- Hospitals and research institutions
- Tertiary treatment of municipal or industrial wastewater

The Versatility of Germicidal UV Purification

UV purification provides germ-free potable water for home, institutional and municipal use, as in the following applications.

- Water wells: bacterial contamination of wells is unpredictable and may occur from seepage of surface water or sewage.
- The outlet side of water cisterns: most cisterns foster the proliferation of bacteria in untreated water.
- Swimming pools: to control bacteria, algae, and slime formation. It avoids the undesirable effects of heavily chlorinated swimming pool water by allowing substantial reduction of the use of chlorine.

UV purification provides bacteria-free food process water without the use of germicides, oxidants, algacides or chemical precipitants; particularly useful in the following applications where chlorine adversely affects flavor.

- Brewery, winery, soft drink, and water bottling industries: where biological purity of the water must be absolutely maintained in order to ensure product quality.
- Dairy products: for safeguarding against spoilage of cottage cheese and butter; certain psychrophilic bacteria are resistant to chlorine treatment.
- Sterile washwater: to guard against waterborne bacteria spoilage where vegetable, fruits, meats, fish, and other products must be washed in water before packaging.

UV purification is particularly useful in the following applications where chlorine-free, de-ionized and/or carbon filtered water are extensively employed. Unattended carbon filters and ion-exchange tanks act as incubators for bacteria accumulation.

- Electronics: in conjunction with de-ionized and high purity water systems.
- Pharmaceuticals and cosmetics: strict water treatment standards are necessary for strict maintenance of product's quality control.
- Biological laboratories: sterile water is required for testing and research work.
- Hospitals: provides pure water on demand for maternity labor and delivery areas, pathology labs, etc.

In industrial pollution control, UV purification affords an excellent end-treatment.

- Wastewater control systems: for selective use as a tertiary treatment for bacteria destruction after removal of chemicals and other objectionable ingredients.
